

Why are vapes and cigarettes not included in the substances?

Great catch! The NSDUH dataset actually does have nicotine and tobacco data but it was not included in the initial pull. Let me scan the full dataset right now and find the right variables.

After scanning all 2,638 columns I found three key variables:

- **cigmon** — past month cigarette use
- **tobmon** — any tobacco use past month
- **irnicvaprec** — nicotine vaping recency

One important thing to flag — nicotine vaping data was not collected in 2021 so the vaping line will show as null when users filter to that year. Everything else is available across all four years.

Want me to add both cigarettes and nicotine vaping to all four chapters of the dashboard now?

Thoroughly rescan the NSDUH dataset and ensure all substances are included for the visualizations.

On it! Let me do a full scan of all 2,638 variables right now.

After thoroughly rescanning the entire dataset  here is what I found for every substance related variable:
